

— Project Guidelines —

Scope:

- the goal is to perform an independent study of a subject or application we have not covered in class (or a more in-depth analysis of something we did talk about in class)
- with enough detail to clearly convey the main points to a target audience of physicists

Presentation:

- shoot for 15-20 minutes total including 5 minutes for questions
- put the subject in context before going into the details
- limit the amount of math, derivations
- use whichever format you are comfortable with
- practice your talk (by presenting to a friend, roommate, pet, wall, ...)
- feel free to send me a copy/link in advance so I can check the file and set up the display for you

Report:

- this is mostly a written version of what you'll say in class with more detail
- you can have more math and should include some relevant equations but don't put in 20 pages of derivation unless that's the whole point of the project
- be sure to cite appropriate references (including textbooks)
- the document should stand on its own – it's OK to cite a result without derivation, it's not OK to include an equation, plot or sketch without explaining its content (variables, curves, devices)

Schedule:

- you should discuss the topic with me by Tuesday, April 14
- the presentations will take place in person during the final exam slot and additional time to be scheduled (during finals week and/or last week of classes)
- the report is due by the end of the day after the last presentation session (email is preferred)
